

Universalgliederband

Fördertechnik für den schonenden Transport unterschiedlichster Güter

Would you like to move articles of various shapes and weights inside your warehouse faster and more efficiently?

For these types of application, SSI SCHAEFER offers universal link belt conveyor systems in different sizes. Universal link conveyor technology is often used in the furniture industry to transport heavy and bulky items within the warehouse or to the outbound goods section.

The advantages of the universal link belt are the simple cleaning of the individual plastic links, which also makes it attractive for the food industry, and the ease of maintenance.

Damaged links can be replaced individually without having to remove the entire belt.

SSI SCHAEFER supplies all the technologies, controls and services required to implement this type of conveyor system in your warehouse. Particularly when it comes to large-scale projects and plants with a high level of complexity, such as inclines or rotary plates, the advantages of working with a partner like SSI SCHAEFER become obvious.

The advantages from SSI SCHAEFER:

- A reliable and complete system all from one source
- Planning and consulting done by the experienced market leader in intralogistics
- Control and integration into existing systems
- High quality, tested and robust components
- Maximum compatibility of all system parts
