

Retrofit

Investitionssicherheit und lange Lebensdauer bestehender Produktionsanlagen

Our retrofit services bring your facility up to date with the latest technological standards, thus increasing the life expectancy of your investment. This can be done with systems from SSI SCHAEFER, as well as with systems from other suppliers.

To determine the actual requirements and the necessary and reasonable retrofitting activities, a thorough facility evaluation by an expert from SSI SCHAEFER is the first step towards greater efficiency.

- Needs-oriented optimisation concept
- Transparent calculation of investment costs
- Comprehensive implementation concept

In planning the retrofit activities we leave no stone unturned. Besides looking into the use of energy-efficient drive units (designed for the application), we naturally put considerable emphasis on mechanical and electrical optimisation.

Talk to us about:

- Lightweight design
- Use of drive models with optimised efficiency
- Reduction in drive input from dead load equalisation
- Minimising friction with suitable material combinations
- Switch-off on demand
- Intermediate circuit connections
- Intelligent activation of the main axles of the storage and retrieval devices
- Energy recovery systems
- ... and much more!

Naturally SSI SCHAEFER also provides consulting across the entire range of intralogistics. Let's start with the basic optimisation of the flow of goods in your warehouse, the load carriers used and innovative workstation design with our ergonomics@work concept. Where it ends is up to you!
